ENSE 271 Project Activity 3 - Customer Check In

-   We should think about the order that someone wants to interact, keeping natural guidance in mind. People typically read and operate starting from the left and going to the right. On our home page, first we have our page title and navigation guidance on the left hand side, then our selection for the report year is on the right side, while the selection wheel is in the middle. We should move the report year selection bar to the left side of the page.

-   On our second page, we are missing long-form writing. On this page, the user should have access to *more* of the information that is on the vital signs report, without having to navigate to the report itself. This can go into the data section, where we initially had visual data and short summaries. We can add long-form writing and information on this page.

-   We should add internal navigation bars. We have options, as we can put another navigation bar under the original one, or have a sidebar that the user can use to navigate around the site without needing to go back to the home page every time they want to go to a different region or key issue.

-   Another way to allow the user to navigate the site with ease would be to add back buttons to every page that takes the user to their previous location.

-   The overall flow of the site was good.
